Audio Management

EasyTouch Audio Management – Individual voice and sound files

Features

- Audio Management:

With this option, individual voice or sound files can be stored in the system for specific events. As soon as the event occurs, the system plays the individual sound file instead of the standard sound file in this case.

In this way, for example, voice output can be stored for workshops for the blind, such as “too light”, “OK” or “too heavy”.

Furthermore, the volume of the sound output can be adjusted individually
